Dentures are also known as false teeth or plates and can be either partial (replacing one or more teeth) or full (replacing all teeth in one jaw or both jaws). Dental implants are a permanent and long-term alternative to dentures and have been used since the mid-1960s to replace missing teeth. They look, feel and function like your own teeth. Your clinician will advise which option will be best for you based on the health of your existing teeth and jaw, your budget and your preference. To explore your options for replacing missing teeth, call Smile Solutions on 13 13 96 to make a dental appointment. Depending on your particular needs, your general dentist may refer you to a periodontist; a prosthodontist; or an oral & maxillofacial surgeon if you are a candidate for dental implants. Book Now What are the different types of dentures? Dentures come in a variety of options designed to suit different treatment needs and personal preferences. Partial Denture A partial denture can be made from three materials: acrylic, metal, or flexible resin. Acrylic dentures are made from rigid resin with a pink gum base and tooth-coloured teeth, typically held in place with metal clasps that may be partially or fully covered by the lips. Metal dentures are a premium option made from cobalt-chrome with a pink acrylic gum section. They are thin, precise-fitting, comfortable, and provide excellent support, with metal clasps helping keep them in place. Flexible resin dentures are pink and made from a bendable material, making them easy to insert. They may include matching clasps but usually have a shorter lifespan than acrylic or metal dentures, so they are often used as a short-term solution. Full Denture A full denture is a pink acrylic denture that replaces all of the teeth in one or both jaws. This means that the denture rests on your gums and does not use clasps. For some patients, full dentures may need to be held in place with adhesive. Full dentures can be made either to look like an ideal dentition or to mimic your natural teeth. A little time is usually required to get used to eating and speaking with them. Over-Denture An over-denture is a device that is made to fit over existing teeth or roots, or over dental implants. An advantage of over-dentures over full dentures is that the teeth or implants act as a secure anchor. Immediate Denture An immediate denture is one that is prepared in advance of tooth extraction, then placed on the same day as the extraction procedure. This ensures that the patient does not spend any time without teeth. However, the immediate denture cannot fit as accurately as a denture made after teeth have been extracted. It can sometimes be made to fit well with a reline, but in most cases it is used as a temporary denture, with a new one being made several months later. Partial Denture A partial denture can be made from three materials: acrylic, metal, or flexible resin. Acrylic dentures are made from rigid resin with a pink gum base and tooth-coloured teeth, typically held in place with metal

clasps that may be partially or fully covered by the lips. Metal dentures are a premium option made from cobalt-chrome with a pink acrylic gum section. They are thin, precise-fitting, comfortable, and provide excellent support, with metal clasps helping keep them in place. Flexible resin dentures are pink and made from a bendable material, making them easy to insert. They may include matching clasps but usually have a shorter lifespan than acrylic or metal dentures, so they are often used as a short-term solution.

Full Denture A full denture is a pink acrylic denture that replaces all of the teeth in one or both jaws. This means that the denture rests on your gums and does not use clasps. For some patients, full dentures may need to be held in place with adhesive. Full dentures can be made either to look like an ideal dentition or to mimic your natural teeth. A little time is usually required to get used to eating and speaking with them.

Over-Denture An over-denture is a device that is made to fit over existing teeth or roots, or over dental implants. An advantage of over-dentures over full dentures is that the teeth or implants act as a secure anchor.

Immediate Denture An immediate denture is one that is prepared in advance of tooth extraction, then placed on the same day as the extraction procedure. This ensures that the patient does not spend any time without teeth. However, the immediate denture cannot fit as accurately as a denture made after teeth have been extracted. It can sometimes be made to fit well with with a reline, but in most cases it is used as a temporary denture, with a new one being made several months later.

Frequently Asked Questions

How long do dentures last? Dentures should be replaced at least every five to seven years. Prosthetic teeth will wear down with daily use, affecting eating after this period of time. Moreover, there can be changes to the gums, lips and cheeks over time (especially in women) and this becomes particularly noticeable after five years with the same denture. We recommend that dentures be refitted and relined periodically throughout their life to counteract shrinkage of the gums, which will loosen their fit.

How often should I clean my dentures? Caring for your dentures will need to become part of your daily routine – just like cleaning your natural teeth. Patients should remove their dentures at night and store them in water or a denture cleaning agent. After overnight storage, clean your dentures each morning with a denture brush and denture cleaner. Specialty denture brushes and nightly cleaning agents can be bought at pharmacies and most supermarkets. Do not place the dentures in boiling water as this may cause permanent distortion of the acrylic material. Some patients are prone to calculus build-up and should have an annual clean and polish of their dentures by the dentist – in the same way you would have your natural teeth cleaned and checked on a regular basis.
